SCHOOL OF COMPUTER SCIENCE AND ARTIFICIAL INTELLIGENCE		DEPARTMENT OF COMPUTER SCIENCE ENGINEERING	
Program Name: B. Tech		**Assignment Type: Lab**	**Academic Year:**2025-2026
CourseCode	23CS002PC304	**Course Title**	AI Assisted Coding
Year/Sem	III/II	**Regulation**	R23
Date and Day of Assignment	**Week4 – Monday**	**Time(s)**	23CSBTB01 To 23CSBTB52
Name	S.Hasitha varshini	**Hall ticket No**	2303A54038
Assignment Number: 8.1			

Q.No.	Question

1	Lab 8: Test-Driven Development with AI – Generating and Working with Test Cases
	Lab Objectives:
	● To introduce students to test-driven development (TDD) using AI code generation tools.
	● To enable the generation of test cases before writing code implementations.
	● To reinforce the importance of testing, validation, and error handling.
	● To encourage writing clean and reliable code based on AI-generated test expectations.
	Lab Outcomes (LOs):
	After completing this lab, students will be able to:
	● Use AI tools to write test cases for Python functions and classes.
	● Implement functions based on test cases in a test-first development style.
	● Use unittest or pytest to validate code correctness.
	● Analyze the completeness and coverage of AI-generated tests.
	● Compare AI-generated and manually written test cases for quality and logic
	
	Task Description #1 (Password Strength Validator – Apply AI in Security Context)
	● Task: Apply AI to generate at least 3 assert test cases for is_strong_password(password) and implement the validator function.
	● Requirements:
	  ○ Password must have at least 8 characters.
	  ○ Must include uppercase, lowercase, digit, and special character.
	  ○ Must not contain spaces.
	Example Assert Test Cases:
	assert is_strong_password("Abcd@123") == True
	assert is_strong_password("abcd123") == False
	assert is_strong_password("ABCD@1234") == True
	Expected Output #1:
	● Password validation logic passing all AI-generated test cases.

lab8_1_4049.py × lab test.py

lab8_1_4049.py > ...

```python
import re

def is_strong_password(password):
    """
    Checks if a password meets strong security criteria:
    - At least 8 characters long
    - Contains no spaces
    - Has at least one uppercase letter
    - Has at least one lowercase letter
    - Has at least one digit
    - Has at least one special character (non-alphanumeric)
    """
    if len(password) < 8 or " " in password:
        return False

    # Check for required character types using regex
    # The regex checks for at least one occurrence of:
    # [A-Z] : Uppercase
    # [a-z] : Lowercase
    # [0-9] : Digit
    # [^\w] : Special character (anything not a word character)
    # Note: \w includes [a-zA-Z0-9_], so underscore is considered a word character here.
    patterns = [r"[A-Z]", r"[a-z]", r"\d", r"[^\w]"]

    return all(re.search(p, password) for p in patterns)
# Test cases
assert is_strong_password("Abcd@123") == True
assert is_strong_password("abcd123") == False
assert is_strong_password("ABcd1234") == False   # no special char
assert is_strong_password("ABCD@1234") == False  # no lowercase
assert is_strong_password("Abc d@123") == False  # contains space
print("Task 1: All tests passed.")

Task Description #2 (Number Classification with Loops – Apply AI for Edge Case Handling)

- Task: Use AI to generate at least 3 assert test cases for a classify_number(n) function. Implement using loops.
- Requirements:
  - Classify numbers as Positive, Negative, or Zero.
  - Handle invalid inputs like strings and None.
  - Include boundary conditions (-1, 0, 1).

Example Assert Test Cases:

assert classify_number(10) == "Positive"

assert classify_number(-5) == "Negative"

assert classify_number(0) == "Zero"

Expected Output #2:

- Classification logic passing all assert tests.

lab8_1_4049.py ✕ lab test.py

lab8_1_4049.py > ...

```python
#Task2
def classify_number(n):
    """
    Classifies a number as Positive, Negative, or Zero.
    Returns 'Invalid Input' for non-numeric types.
    """
    if not isinstance(n, (int, float)):
        return "Invalid Input"

    if n > 0:
        return "Positive"
    elif n < 0:
        return "Negative"
    else:
        return "Zero"

# Test cases
assert classify_number(10) == "Positive"
assert classify_number(-5) == "Negative"
assert classify_number(0) == "Zero"
assert classify_number(1) == "Positive"
assert classify_number(-1) == "Negative"
assert classify_number("abc") == "Invalid Input"
assert classify_number(None) == "Invalid Input"
print("Task 2: All tests passed.")

Task Description #3 (Anagram Checker – Apply AI for String Analysis)

- Task: Use AI to generate at least 3 assert test cases for is_anagram(str1, str2) and implement the function.
- Requirements:
  - Ignore case, spaces, and punctuation.
  - Handle edge cases (empty strings, identical words).

Example Assert Test Cases:

assert is_anagram("listen", "silent") == True

assert is_anagram("hello", "world") == False

assert is_anagram("Dormitory", "Dirty Room") == True

Expected Output #3:

- Function correctly identifying anagrams and passing all AI-generated tests.

Task Description #4 (Inventory Class – Apply AI to Simulate Real-World Inventory System)

- Task: Ask AI to generate at least 3 assert-based tests for an Inventory class with stock management.
- Methods:
  - add_item(name, quantity)
  - remove_item(name, quantity)
  - get_stock(name)

Example Assert Test Cases:

inv = Inventory()

inv.add_item("Pen", 10)

assert inv.get_stock("Pen") == 10

inv.remove_item("Pen", 5)

assert inv.get_stock("Pen") == 5
inv.add_item("Book", 3)
assert inv.get_stock("Book") == 3

Expected Output #4:

- Fully functional class passing all assertions.

Task Description #5 (Date Validation & Formatting – Apply AI for Data Validation)

- Task: Use AI to generate at least 3 assert test cases for validate_and_format_date(date_str) to check and convert dates.
- Requirements:
    - Validate "MM/DD/YYYY" format.
    - Handle invalid dates.
    - Convert valid dates to "YYYY-MM-DD".

Example Assert Test Cases:

assert validate_and_format_date("10/15/2023") == "2023-10-15"
assert validate_and_format_date("02/30/2023") == "Invalid Date"
assert validate_and_format_date("01/01/2024") == "2024-01-01"

Expected Output #5:

- Function passes all AI-generated assertions and handles edge cases.
